Documentation, Codebook, and Frequencies

MEC Exam Component: Blood Pressure Examination Data

Survey Years: 2003 to 2004

SAS Export File: BPX_C.XPT

December 2005
Accurate measurement of blood pressure (BP) is a major public health concern; it is essential for hypertension screening, as well as for disease management. Hypertension is a powerful, consistent, and independent risk factor for cardiovascular disease and renal disease.

Heart rate is measured on all children 0-4 years of age; radial pulse is measured on examinees 5 years and older; and blood pressure (BP) is measured on all examinees 8 years and over. There are no exclusion criteria.

After resting quietly in a sitting position for 5 minutes and determining the maximum inflation level (MIL), three and sometimes 4 BP determinations (systolic and diastolic) are taken in the mobile examination center (MEC).
Quality Assurance & Quality Control

The BP examiners are certified for blood pressure measurement through a training program from *Shared Care Research and Education Consulting*. The program includes a didactic section, audio-video practice watching and listening to systolic and diastolic blood pressure sounds, and measuring blood pressures of volunteers concurrently with a certified, gold standard BP instructor. Certification is achieved when physician examiners meet all requirements of the training program. The initial training includes:

- didactic instruction about BP measurement and propensity for error;
- practice listening to systolic and diastolic BP sounds using a standardized audio-video tape presentation;
- audio-video tape test;
- written exam;
- examiner and gold standard instructor simultaneously listening to BP of a minimum of 20 volunteers of all ages through a Y-stethoscope to compare measures; and
- observation of protocol technique using a checklist.

Certification requires a score of 100 per cent on the audio-video tape test. Correct answers on the audio-video tape test require the examiner's answers and the standardized test answers to be within +/- 2mm mercury (Hg) on 92 per cent of 24 measures (12 systolic, 12 diastolic), and within +/- 4mm Hg on 100 percent of 24 measures (12 systolic, 12 diastolic). For more information on quality assurance and control, see Ostchega et al. (1).

For more details on the QA/QC process for this component, please refer to the Physician Section of the *MEC Operations Manual*. 
The following are some hard edit specifications used in capturing the BP data:

- systolic blood pressure and maximum inflation level cannot be greater than 300 mmHg;
- systolic and diastolic blood pressure and maximum inflation level can be even numbers only;
- systolic blood pressure must be greater than diastolic blood pressure;
- if there is no systolic blood pressure, there can be no diastolic blood pressure;
- diastolic blood pressure can be zero.
